AB Novel approaches to target GSTP-1 have produced two new anticancer drugs. A GSTP1-1 activated nitrogen mustard prodrug (TER286) is selectively cytotoxic to tumors, which express high levels of the isoenzyme. Cells transfected with GSTP1-1 are more sensitive to the drug and resistant cells down regulate GSTP1-1 expression. A peptidomimetic inhibitor of GSTP1-1 (TER199) which modulates drug resistance when given in combination with either alkylating agents or natural products also ameliorated drug-induced bone marrow suppressive effects and possessed myeloproliferative activity. This effect is consistent with drug induced dissociation of GSTP1-1 from JNK with resultant downstream proliferative effects.

AB TER286 [γ -glutamyl- α -amino- β (2-ethyl-N,N,N',N'-tetrakis(2-chloroethyl)phosphorodiamidate)-sulfonyl-propionyl-(R)-(-) phenylglycine] is a novel nitrogen mustard prodrug that is preferentially activated by glutathione S-transferase P1-1 (GSTP1-1). A human promyelocytic leukemia /TER286-resistant cell line was selected by chronic, long-term exposure to the prodrug. Although resistance was not readily achieved, eventually a 5-fold resistant clone was isolated. Cross-resistance to melphalan occurred, but not to doxorubicin (Adriamycin), taxol, and γ -glutamyl-S-(benzyl)cysteinyl-R(-)-Ph glycine di-Et ester, a

GSTP1-1 inhibitor. The protein and transcript levels and enzymic activity of GSTP1-1 were reduced significantly in the selected resistant line. GST α levels were unchanged, and GST μ was undetectable. Although glutathione levels were elevated in human promyelocytic leukemia/TER286 cells, no changes in the expression of thiol-related genes including γ -glutamylcysteine synthetase, γ -glutamyl transpeptidase, or multidrug resistance protein were found. A 7-fold increase in catalase expression in the resistant cell line indicated an adaptive response to oxidative and electrophilic stress, and this was also reflected in the lower prevalence of drug-induced DNA single-strand breaks in the resistant cells. Mouse embryo fibroblast GSTP1-1-/- cells exhibited 2-fold resistance to TER286 compared with GSTP1-1+/+ cells. NIH3T3 cells transfected with combinations of γ -GCS and multidrug resistance protein exhibited enhanced resistance to TER286, although the degree of resistance was impaired by co-transfection of GSTP1-1. These results are consistent with responses in the TER286-resistant cells indicative of GSTP1-1-mediated mechanism of activation. In consequence, these data support the rationale that tumors expressing high levels of GSTP1-1 will be more sensitive to the cytotoxic effects of the drug.
